SGLT-2 inhibitors

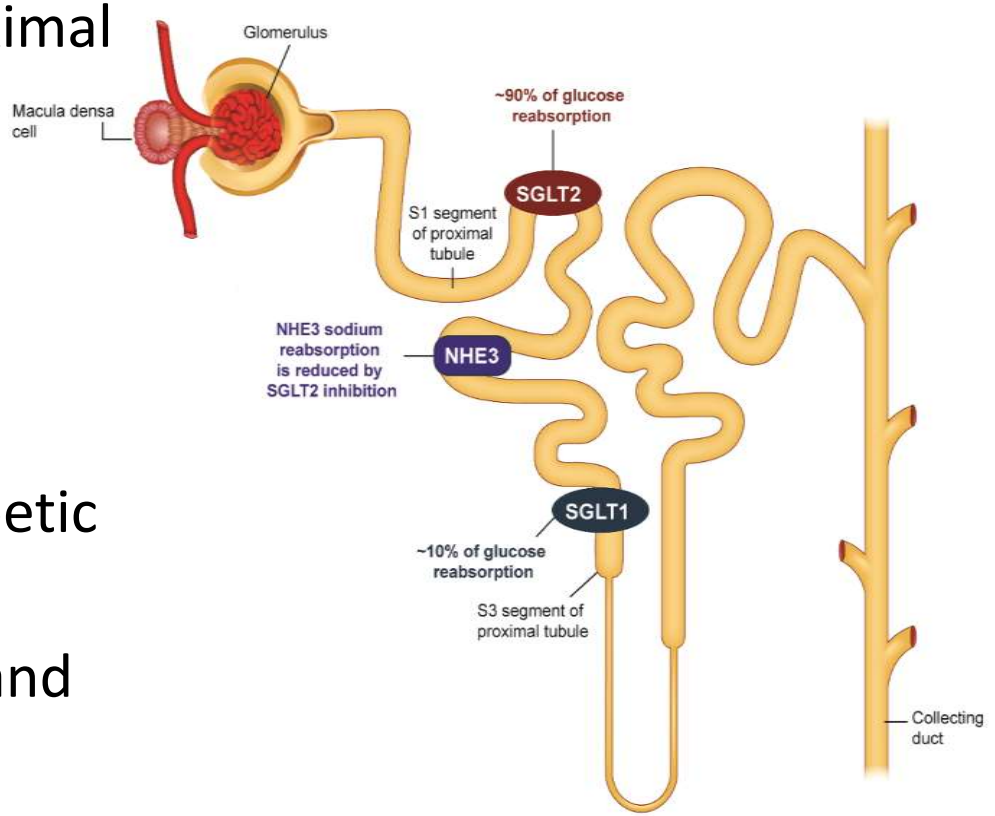
Sodium glucose co-transporter 2 (SGLT2) inhibitors

- SGLT2 almost exclusively expressed in the proximal tubules (PT)
  - 90% of filtered glucose is reabsorbed in the apical membrane of the PT by SGLT2
- Modestly lower HbA1c
- Modestly lower SBP
- Durable and significant protection against diabetic kidney disease and cardiovascular disease
- Mechanism of protection likely multifactorial and incompletely understood



Lytvyn et al. *Endocrin Review. 2020*

SGLT-2 inhibitors

Sodium glucose co-transporter 2 (SGLT2) inhibitors

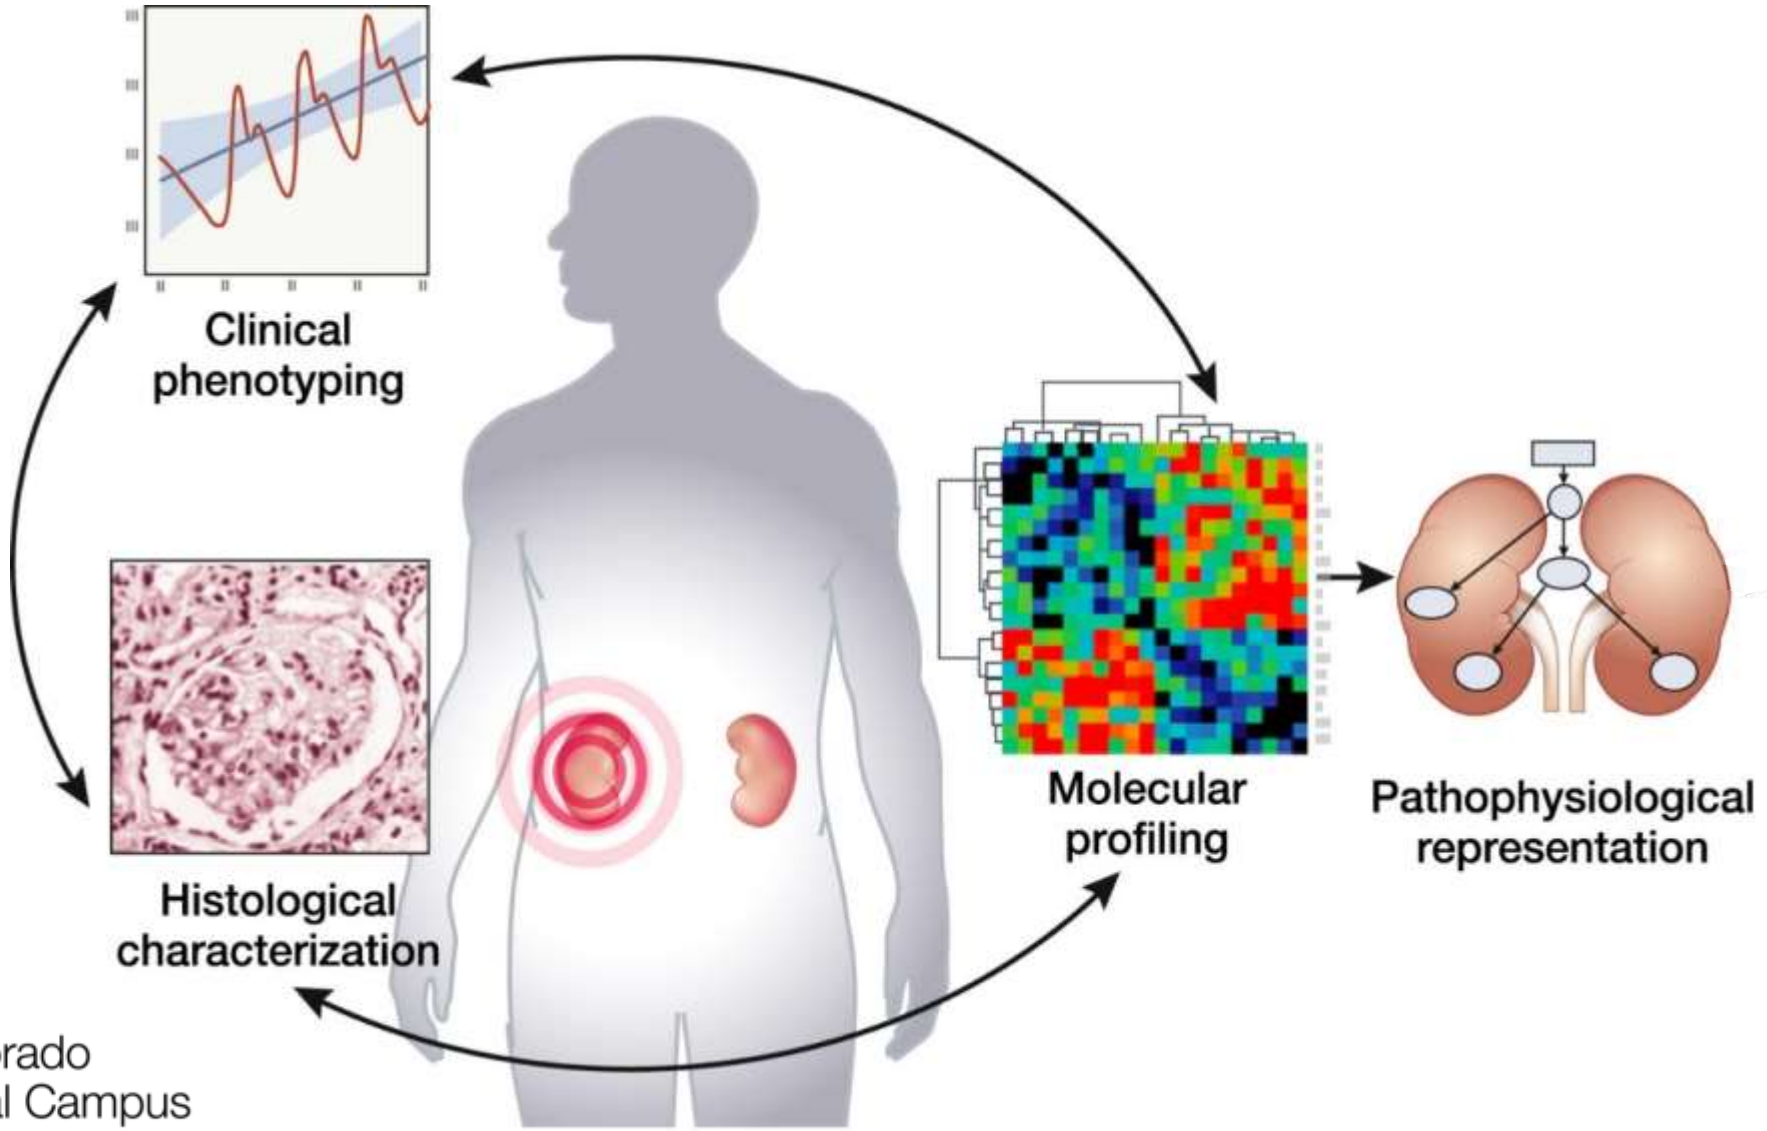
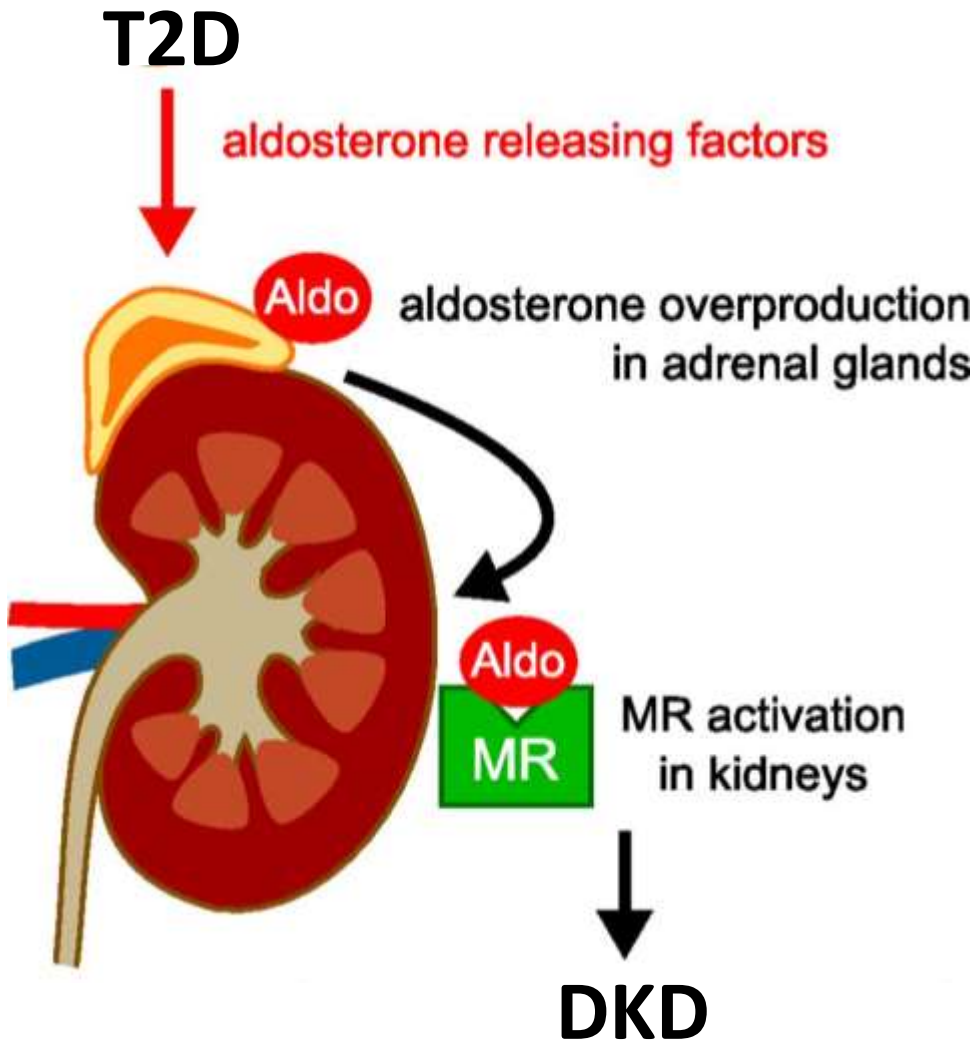
Single-sample Gene Set Enrichment Analysis



Mineralocorticoid receptor antagonist (MRA): Finerenone

Mineralocorticoid receptor (MR) antagonists

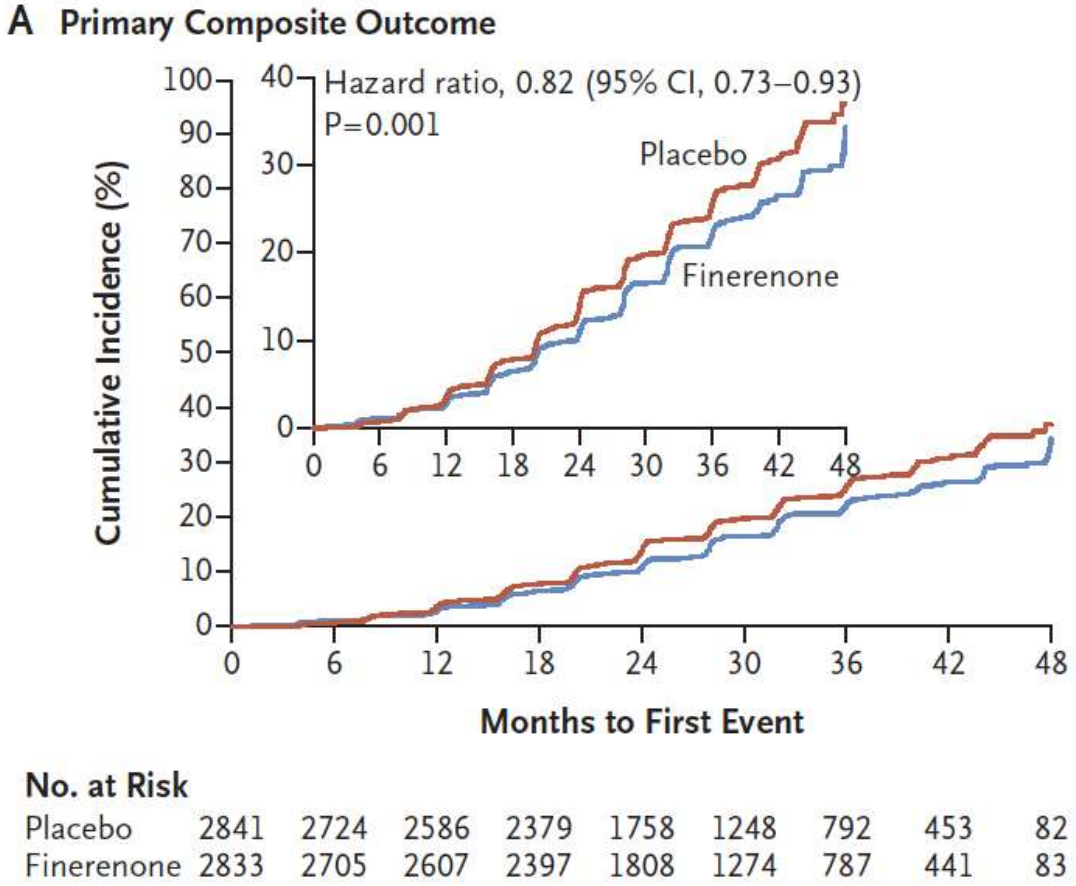
- T2D has been linked to inappropriate MR activation with resultant inflammation and fibrosis.
- Murine MR knockout models showed protection against kidney inflammation and fibrosis.
- In CRIC, higher serum aldosterone concentrations predicted greater risk of CKD progression in adults with and without T2D.



Verma et al. EHJ 2022

Mineralocorticoid receptor antagonist (MRA): Finerenone

Mineralocorticoid receptor (MR) antagonists



The primary composite outcome in FIDELIO-DKD: kidney failure, a sustained decrease of at least 40% in the eGFR from baseline, or death from renal causes.

University of Colorado Anschutz Medical Campus

Bakris et al. *NEJM* 2021

Endothelin receptor antagonist (ERA): Atrasentan

Endothelin receptor antagonists

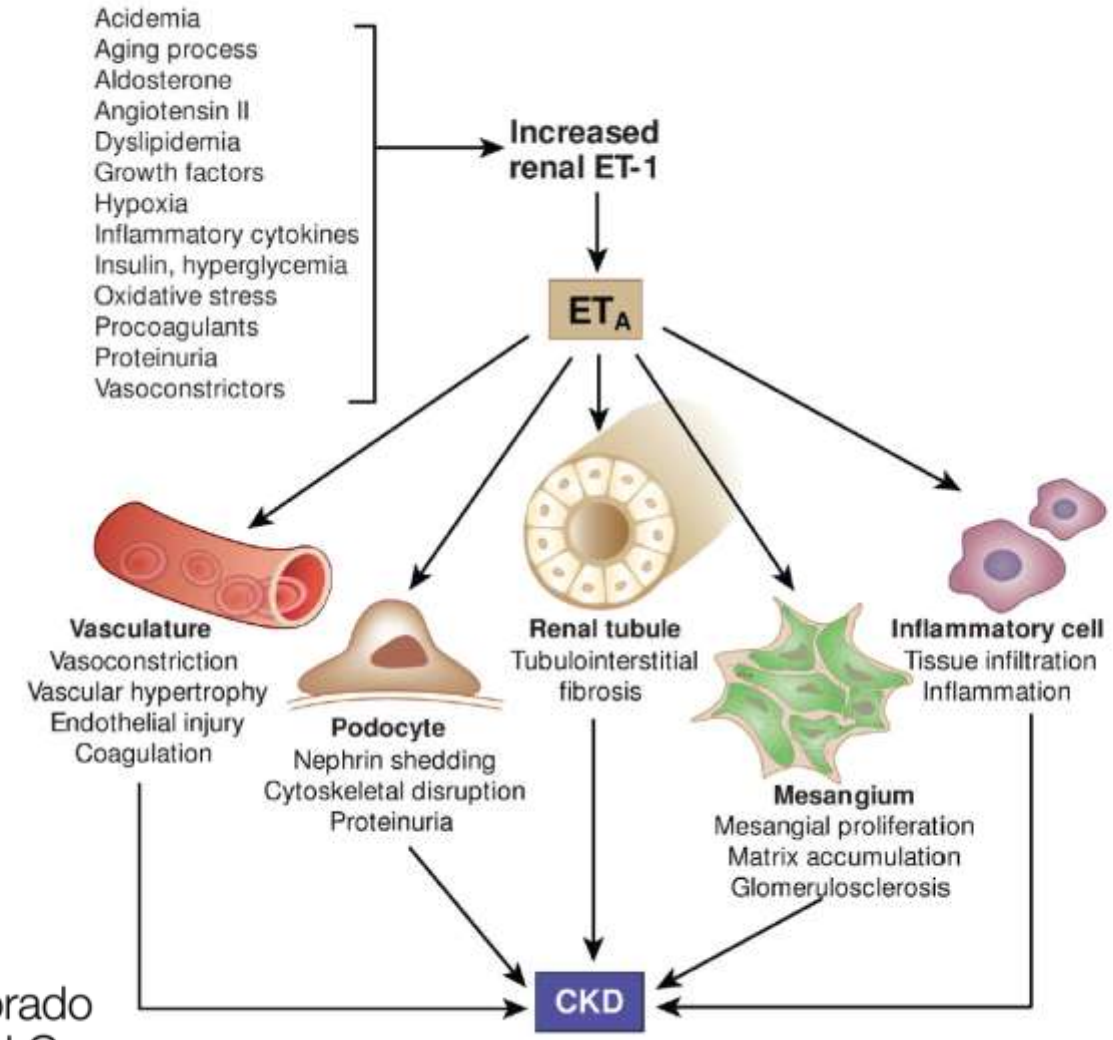
- Endothelins (1-3) linked to various diseases, including DKD
  - In CKD/DKD: increased kidney endothelin-1 production

- Endothelin receptor A (ERA) and Endothelin receptor B (ERB)
  - ERA activation induces pro-inflammatory and pro-fibrotic pathways, glomerular hyperfiltration through vasoconstriction efferent vasculature
  - ERB in collecting duct stimulate sodium excretion

Kohan et al. *Kidney Int* 2014
Dhaun et al. *Hypertension* 2009
Hunter et al. *Hypertension* 2009

Endothelin receptor antagonist (ERA): Atrasentan

Endothelin receptor A activation



ERA Blockade reduces:

- Systemic blood pressure
- Glomerular hypertension
- Efferent vasodilation
- Proteinuria

But increases sodium retention

Role of ERB blockade

Kohan et al. *Kidney Int* 2014

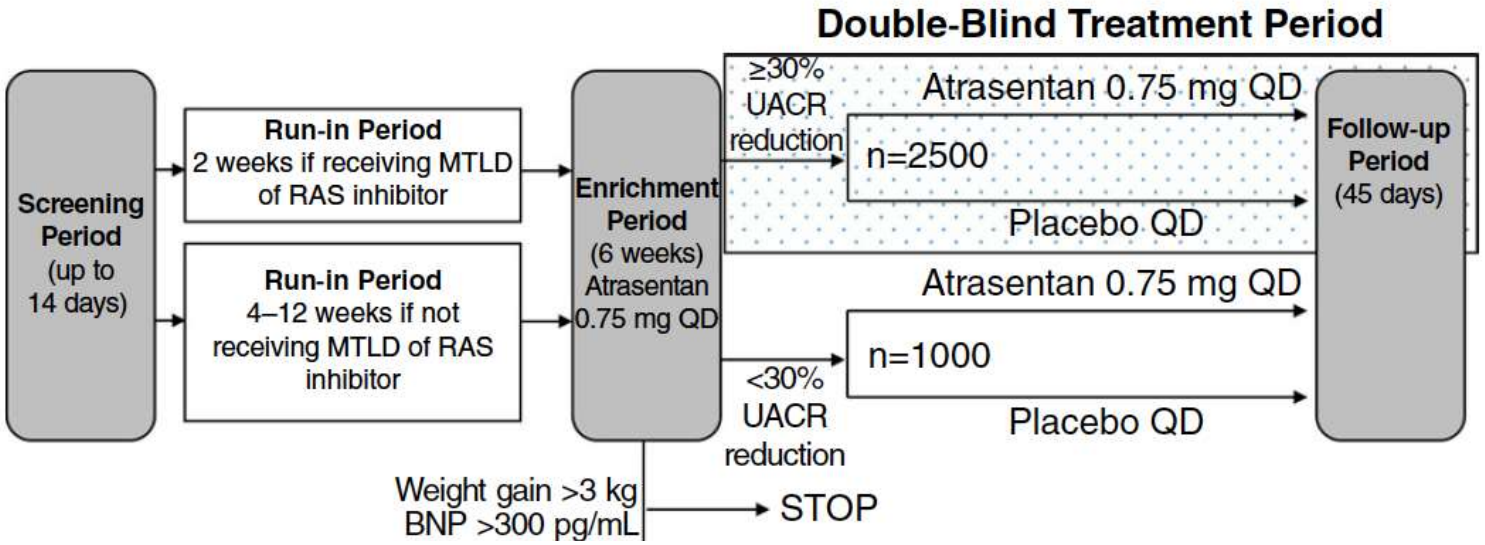
Dhaun et al. *Hypertension* 2009

Hunter et al. *Hypertension* 2009

Endothelin receptor antagonist (ERA): Atrasentan

Atrasentan ($ET_{A:B}$ 1200:1): design of the SONAR trial

Phase-3 trial
3500 T2D patients
Macroalbuminuria
CKD stages 2-4
BNP<200 pg/mL
Atrasentan 0.75 mg/d



Primary composite endpoint:
1. Time to doubling of serum creatinine from baseline (confirmed by 30-day serum creatinine)
2. Time to ESRD defined as eGFR <15 mL/min/1.73 m^2, need for chronic dialysis (both confirmed after 90 days), renal transplantation or renal death

Prematurely ended due to few events

Heerspink et al. *DOM* 2018

Endothelin receptor antagonist (ERA): Atrasentan

Main outcomes of the SONAR trial

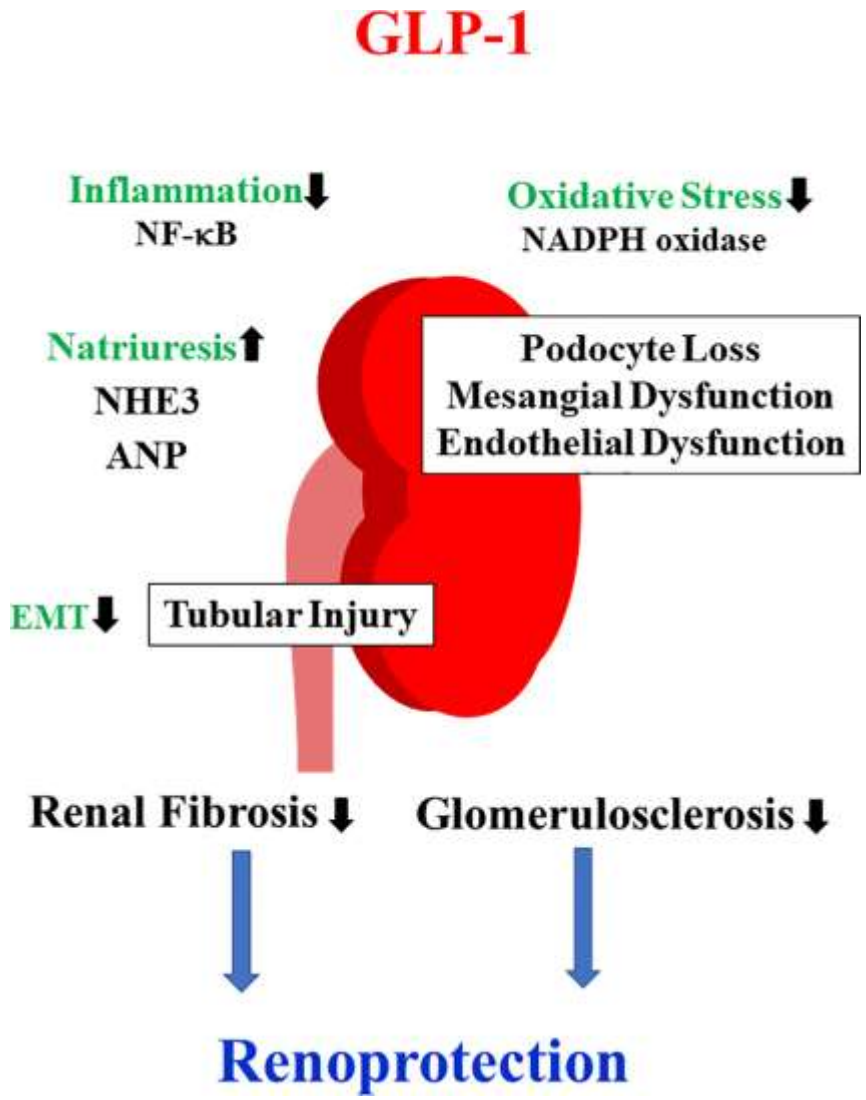
	Atrasentan (n=1325)		Placebo (n=1323)		Hazard ratio (95% CI)	p value*
	Number	Annual rate	Number	Annual rate		
Primary outcome						
Composite renal outcome	79 (6·0%)	2·8%	105 (7·9%)	3·7%	0·65 (0·49–0·88)	0·0047
Doubling of serum creatinine	56 (4·2%)	2·0%	78 (5·9%)	2·7%	0·61 (0·43–0·87)	0·0055
End-stage kidney disease	67 (5·1%)	2·4%	81 (6·1%)	2·9%	0·73 (0·53–1·01)	0·060

Heerspink et al. *Lancet* 2019

Glucagon-like peptide (GLP)-1 receptor agonist

Glucagon-like peptide-1 (GLP-1) receptor agonists

- GLP-1 peptide hormone released from L-cells of the distal ileum in response to oral glucose.
- GLP-1 receptor activation has many effects:
  - Insulin secretion
  - Insulin sensitization
  - Increased perfusion
  - Reduced fibrosis
  - Reduced inflammation
- GLP-1RAs lower albuminuria and may attenuate eGFR decline in high-risk people with T2D.



Glucagon-like peptide (GLP)-1 receptor agonist

GLP-1: preliminary evidence for kidney protection

- REWIND cardiovascular outcome trial with dulaglutide

	Dulaglutide (n=4949)		Placebo (n=4952)		Hazard ratio (95% CI)	p value
	Number of patients (%)	Incidence rate (number of events per 100 person-years)	Number of patients (%)	Incidence rate (number of events per 100 person-years)		
Main analyses of renal effect						
Sustained decline in eGFR of ≥40%	169 (3·4%)	0·66	237 (4·8%)	0·93	0·70 (0·57–0·85)	0·0004

Gerstein HC. Lancet. 20179; 394:131-8.

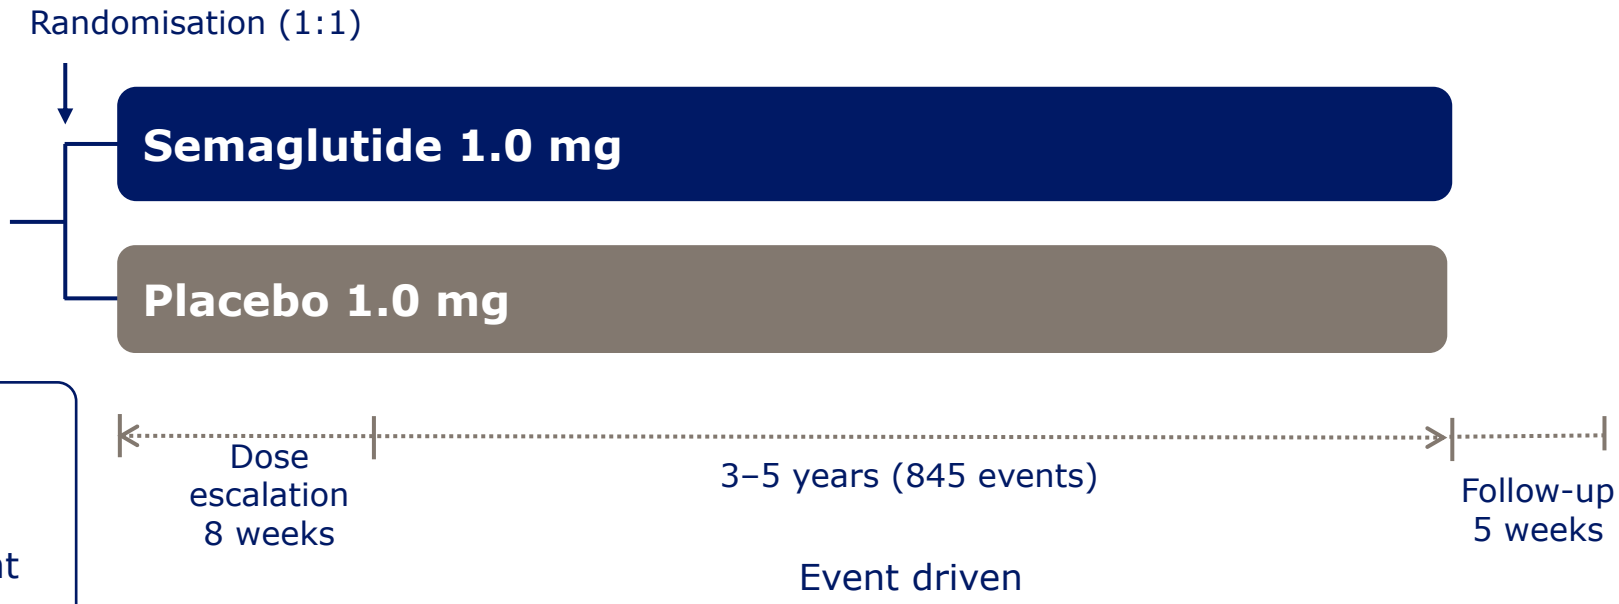
Glucagon-like peptide (GLP)-1 receptor agonist

FLOW: renal outcomes trial with semaglutide

TRIAL DESIGN

3,120 participants with T2D

- HbA_{1c} ≤10%
- RAAS blocker
- eGFR ≤75 and ≥50* and UACR >300 mg/g OR eGFR <50 and ≥25*and UACR >100 mg/g



Trial rationale

- To assess the effect of semaglutide vs placebo on the progression of renal impairment in subjects with T2D and CKD

Primary endpoint

- Composite of selected renal endpoints; renal death; CV death

Secondary confirmatory endpoints

- Change in eGFR (eGFR slope); MACE; all-cause mortality

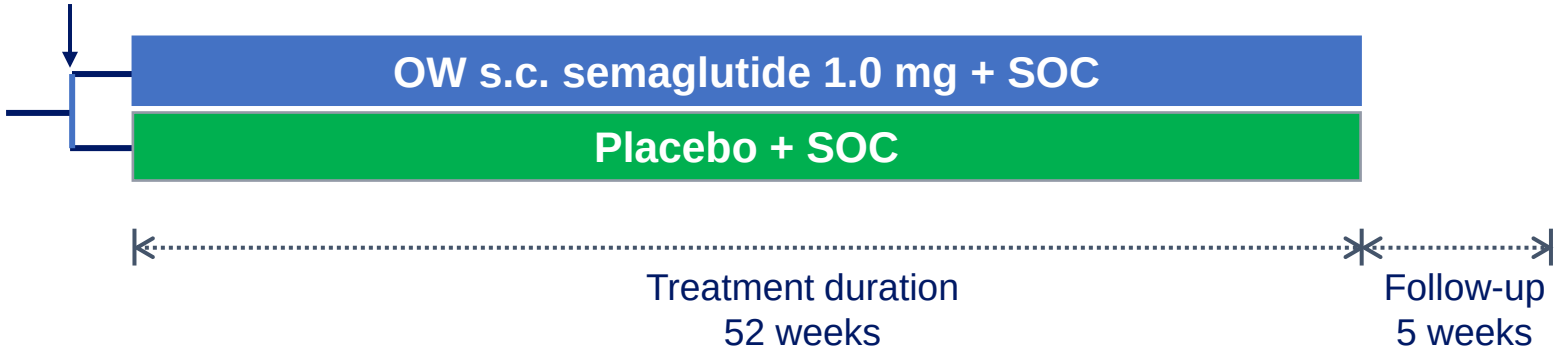
REMODEL: A Research Study to Find Out How Semaglutide Works in the Kidneys Compared to Placebo, in People With Type 2 Diabetes and Chronic Kidney Disease

NCT04865770

105 participants with T2D

- HbA_{1c} ≤9.0% (≤75 mmol/mol)
- RAAS blocker treatment*
- eGFR ≥40 to <75 mL/min/1.73 m^2
- UACR ≥30 to ≤5,000 mg/g†
- Capped SGLT-2i use

Randomisation (2:1)



Trial information

- Multicentre trial
- Assessments included clinical + imaging, kidney biopsies (n=45); multiparametric MRI, GFR measurements, biochemistry and biobanking
- Conducted in Canada, France, Italy, Poland, South Africa, Spain, United States.

Key endpoints

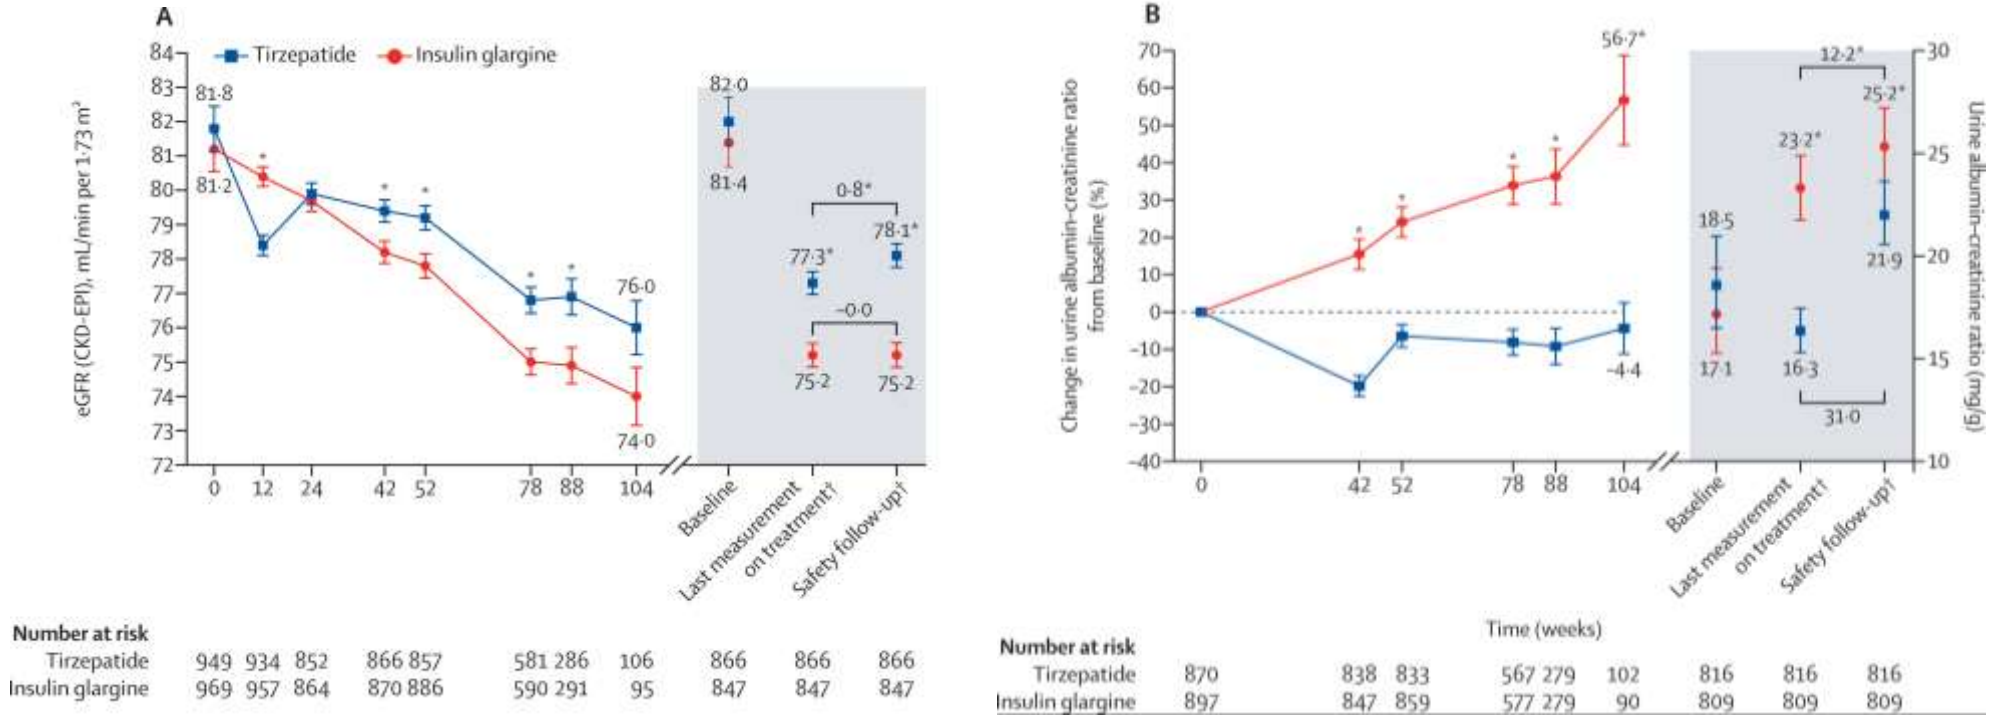
- **Clinical:** Change in UACR and mGFR
- **Anti-inflammation:** change in inflammatory gene expression (single-nucleus RNAseq; from biopsies), biomarkers and T1+T2 mapping (measured using MRI)
- **Oxidative stress:** change in ROS gene expression and biomarkers (circulating and urine)
- **Hemodynamics:** change in kidney hypoxia (measured using MRI) and RAAS biomarkers and gene expression; mean arterial flow & perfusion (measured using MRI)

Steering Committee

Participating countries

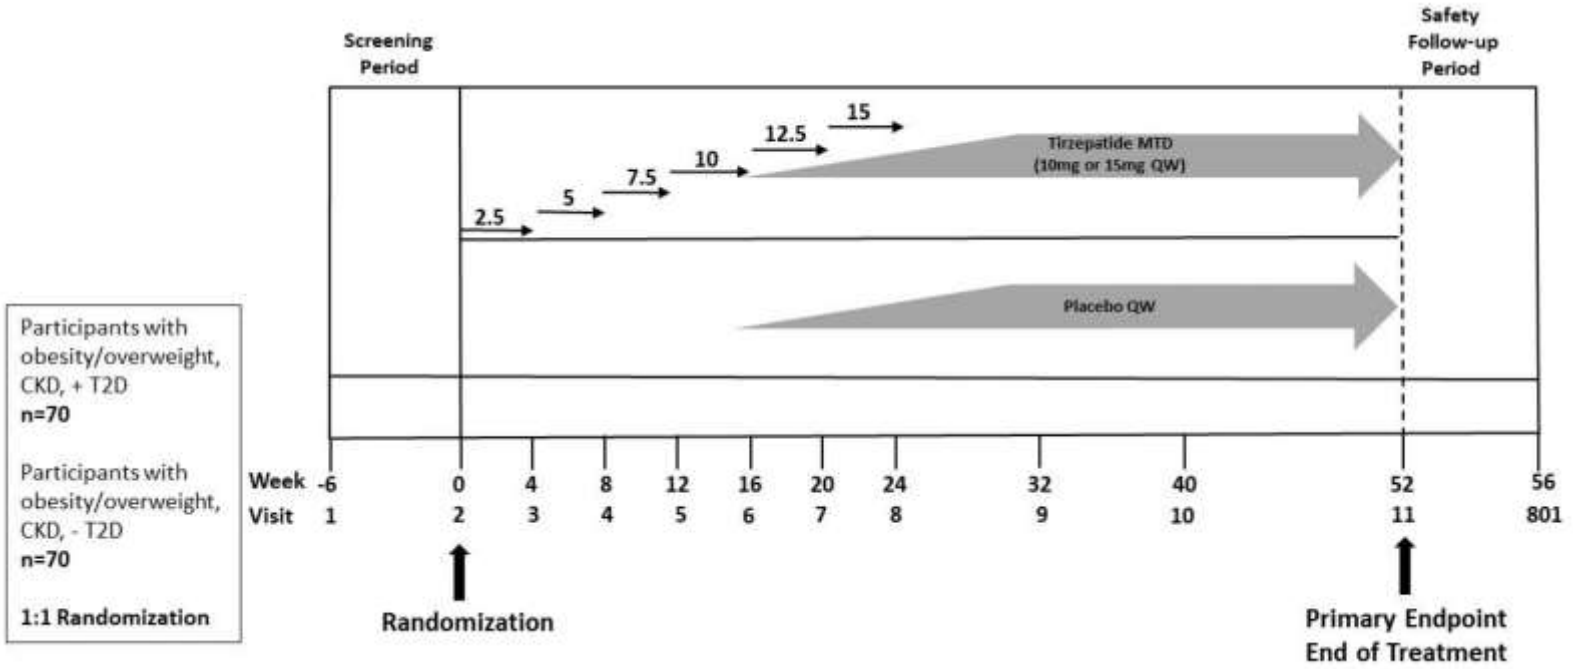
GLP-1/GIP: prelim. evidence for kidney protection

- Posthoc analysis of SURPASS-4 trial (tirzepatide):



Heerspink et al. Lancet Diabet. Endocrinol 2022

TREASURE CKD: Tirzepatide Mechanism of Action Study on Renal Function (TREASURE-CKD)



Key endpoints

- **Clinical:** Change in UACR and mGFR
- **Kidney oxygenation, perfusion and renal blood flow:** multiparametric MRI
- **Kidney oxidative metabolism:** C-11 acetate PET

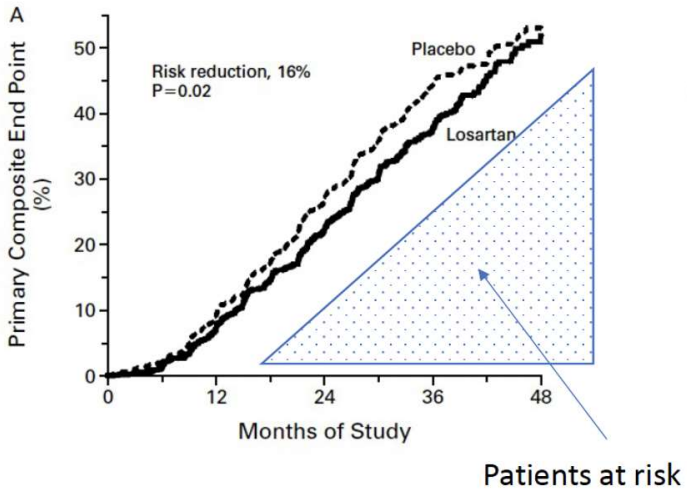
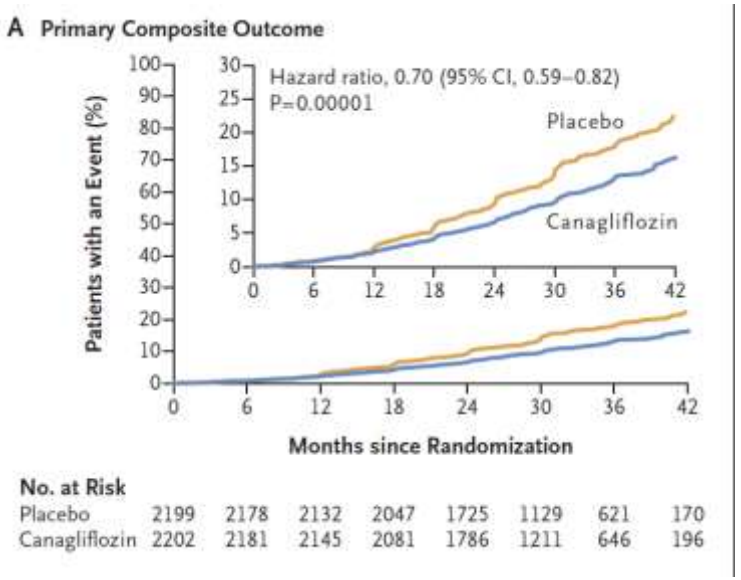
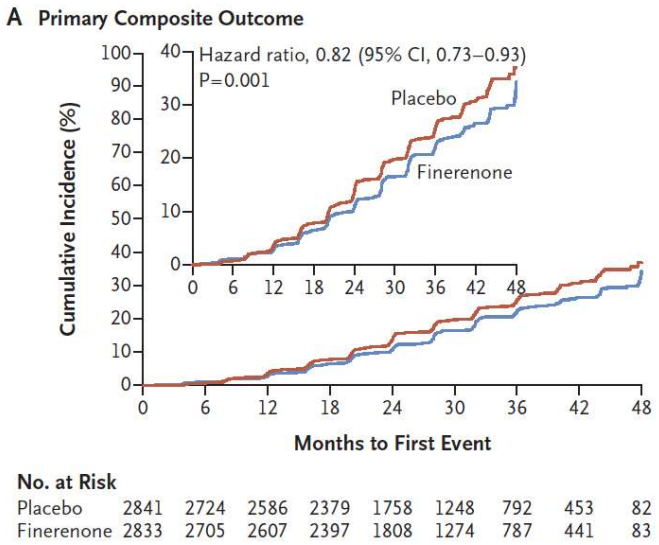
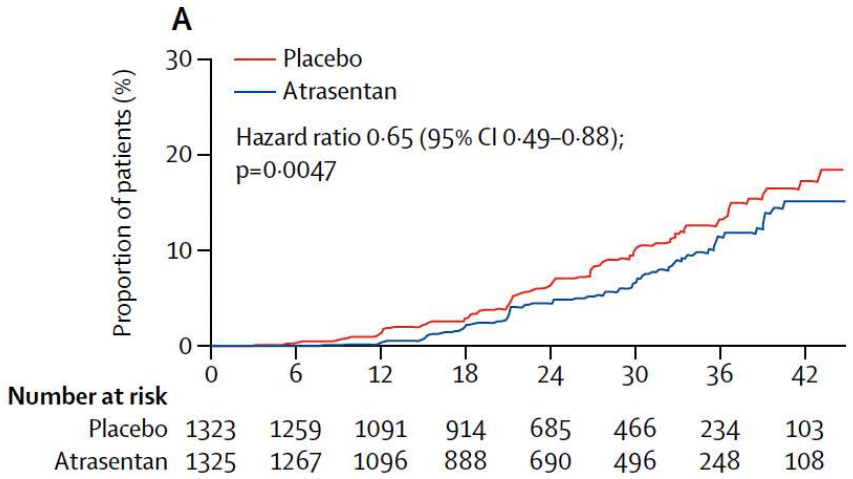
Do we need to combine these drugs?









How can we combine these drugs?

1) Do these drugs have additive effects (efficacy)? → Mechanism of action

2) Do these drugs have (potential) problematic interactions?

3) Can these drugs mitigate agent-specific adverse effects?

1) Individual kidney protective mechanisms

RAAS blockers

Amelioration of glomerular hyperfiltration

Endothelial effects angiotensin-II blockade

Resulting in postglomerular/efferent dilation

Reduction blood pressure

SGLT-2 inhibitors

Amelioration of glomerular hyperfiltration

Activation of tubuloglomerular feedback

Reduction kidney workload/kidney hypoxia

Reduction blood pressure

MRA: Finerenone

Reduction in fibrosis

Reduction in inflammation

ERA: Atrasentan

Reduction in inflammation

Reduction in glomerular pressure

Improved endothelial function

GLP-1RA

Reduction in fibrosis

Reduction in inflammation

Improved energetics

Efficacy

RAAS blockers ⟷ **SGLT-2 inhibitors**

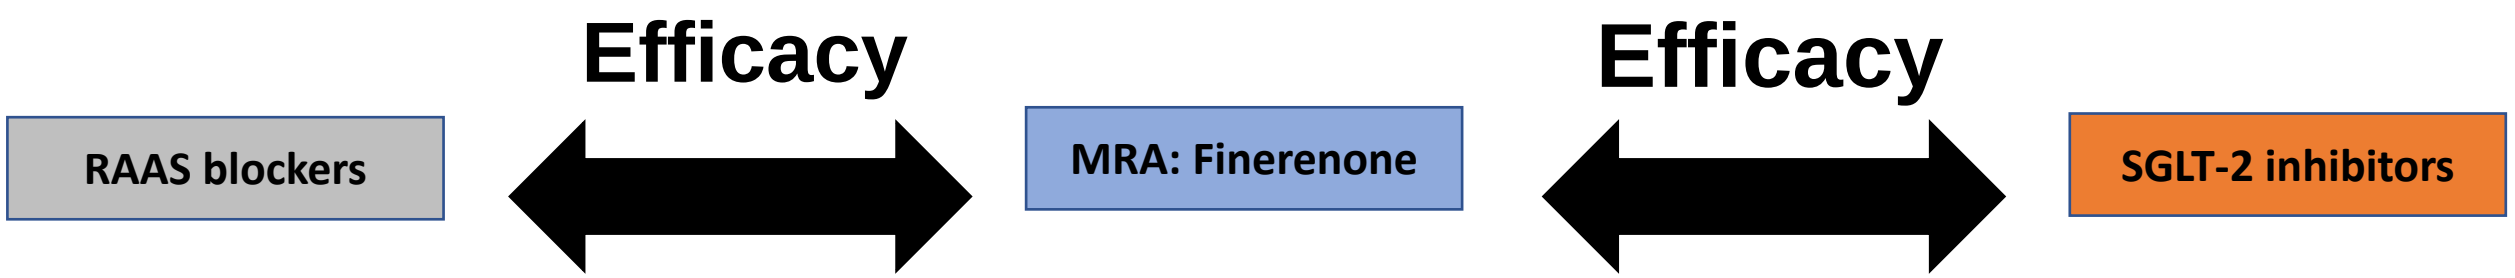
Fufa et al. Clin J Am Soc Nephrol, 2016

Efficacy

- Systematic review and meta-analysis by Li et al examining trials that combined SGLT2 inhibitors + GLP-1RA showed superior effects (compared to monotherapy) on reducing:
  - HbA1c
  - Body weight and BMI
  - SBP
  - LDL-C
- However, outcome trials with kidney endpoints are needed to determine additive effects.

Li et al. Front Pharmacol. 2022



- We have limited data regarding potential additive effects
- Mechanisms seem complementary
- Background FIDELIO: RAAS blockade 100%, SGLT2 inhibition 5%

A Study to Learn How Well the Treatment Combination of Finerenone and Empagliflozin Works and How Safe it is Compared to Each Treatment Alone in Adult Participants With Long-term Kidney Disease (Chronic Kidney Disease) and Type 2 Diabetes (CONFIDENCE)

Albuminuria Lowering Effect of Dapagliflozin, Eplerenone and Their Combination in Patients with Chronic Kidney Disease: A Randomized Cross-Over Clinical Trial

JASN
JOURNAL OF THE AMERICAN SOCIETY OF NEPHROLOGY

METHODS

46 patients

- Age ≥18 years
- UACR 100-3500 mg/24-hour
- eGFR >30 - <90 mL/min/1.73m²
- Stable (>4 weeks) dose of ACEi **or** ARB

Dapagliflozin 10 mg → **Eplerenone** 50 mg → **Eplerenone** 50 mg **Dapagliflozin** 10 mg

4-weeks treatment in random order with 4-weeks wash-out in between

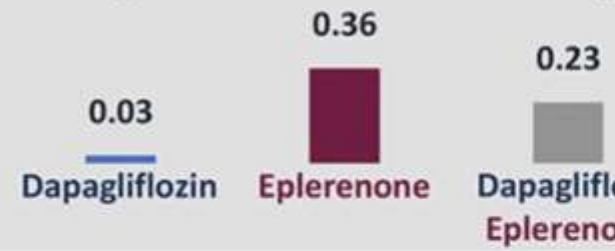
OUTCOMES

UACR change (%) from baseline

combination vs. dapa: p<0.001

combination vs. eple: p=0.0127

Change from baseline in serum K (mmol/L)



combination vs. dapa: p<0.0018

combination vs. eple: p=0.0296

Conclusion

Dapagliflzoin in combination with eplerenone reduced albuminuria to a greater extent than either drug alone. Compared to eplerenone, dapagliflozin-eplerenone combined decreased serum potassium.

doi: 10.1681/ASN.2022020207

Heerspink et al, ROTATE 3 study, 2022

Efficacy

MRA: Finerenone ⟷ **GLP-1RA**

Figure 1. Analysis of efficacy outcomes in patients receiving/not receiving a GLP-1RA

	Finerenone n/N (%)	Placebo n/N (%)	Finerenone n per 100 PY	Placebo n per 100 PY	Hazard ratio (95% CI)	$p_{interaction}$
Cardiovascular composite

Anschutz Medical Campus

Neuen et al. *Circulation* 2022

Safety

Safety

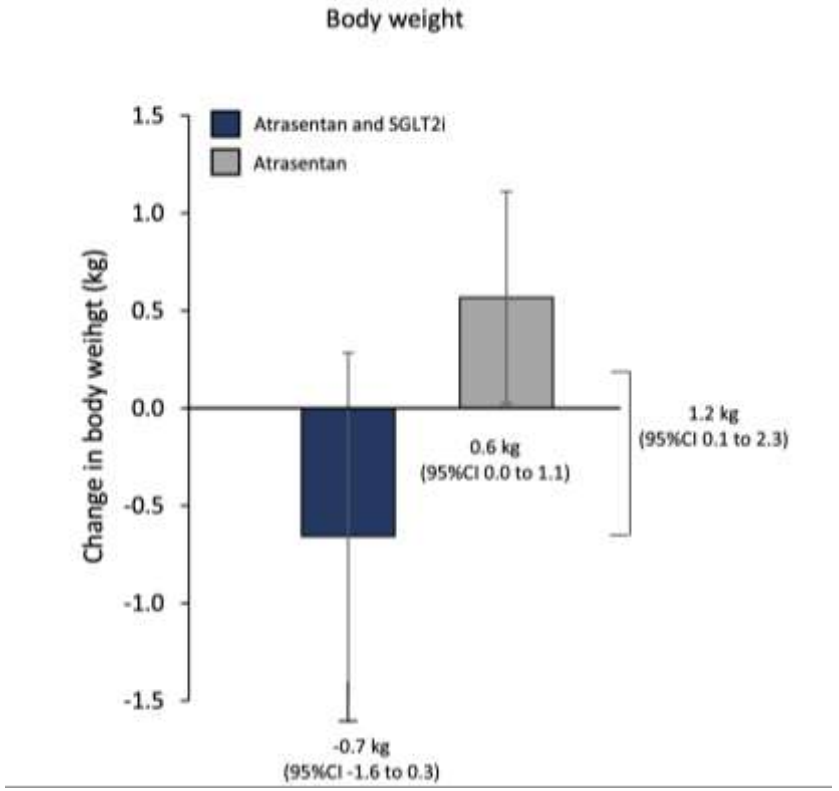
RAAS blockers

ERA: Atrasentan

SGLT-2 inhibitors

- The main problem with ERA is fluid retention and hypertensive HF (despite stringent NT-proBNP levels in exclusion criteria)

**Interaction studied in the ongoing ZENITH-CKD trial (Zibotentan and Dapagliflozin)*



Heerspink et al. Kidney Int. 2020

Conclusions

- Additive vasodilative kidney hemodynamic actions contributing to beneficial mGFR ”dip”
- Additive beneficial effects on systemic blood pressure
- Combination is safe
- Support early combination of these drugs to halt DKD

- Interaction studies are largely unavailable
- Based on different mechanism of action, efficacy could be additive
- No major safety concerns with respect to side effects
- SGLT2 could off-set specific adverse effects of ERA and MRA drugs

Current knowledge gaps

- Mechanism of action data for finerenone and ERA in humans
- Cross-over combination therapy studies
- DKD versus non-diabetes CKD studies
- Studies in people with T1D and youth with T2D
- Outcome trials for dual (e.g., tirzepatide) and triple incretin agonists

New Guidelines!

Screening recommendations

Who and when to screen?

T1D Yearly starting 5 years after diagnosis

T2D Yearly starting at diagnosis

How to screen?

Spot urine ACR

and

eGFR

What to do with a positive result?

Repeat and confirm:
- Evaluate possible temporary or spurious causes
- Consider using cystatin C and creatinine to more precisely estimate GFR
- Only persistent abnormalities define CKD

Initiate evidence-based treatments

What defines CKD diagnosis?

Persistent urine ACR ≥30 mg/g

and/or

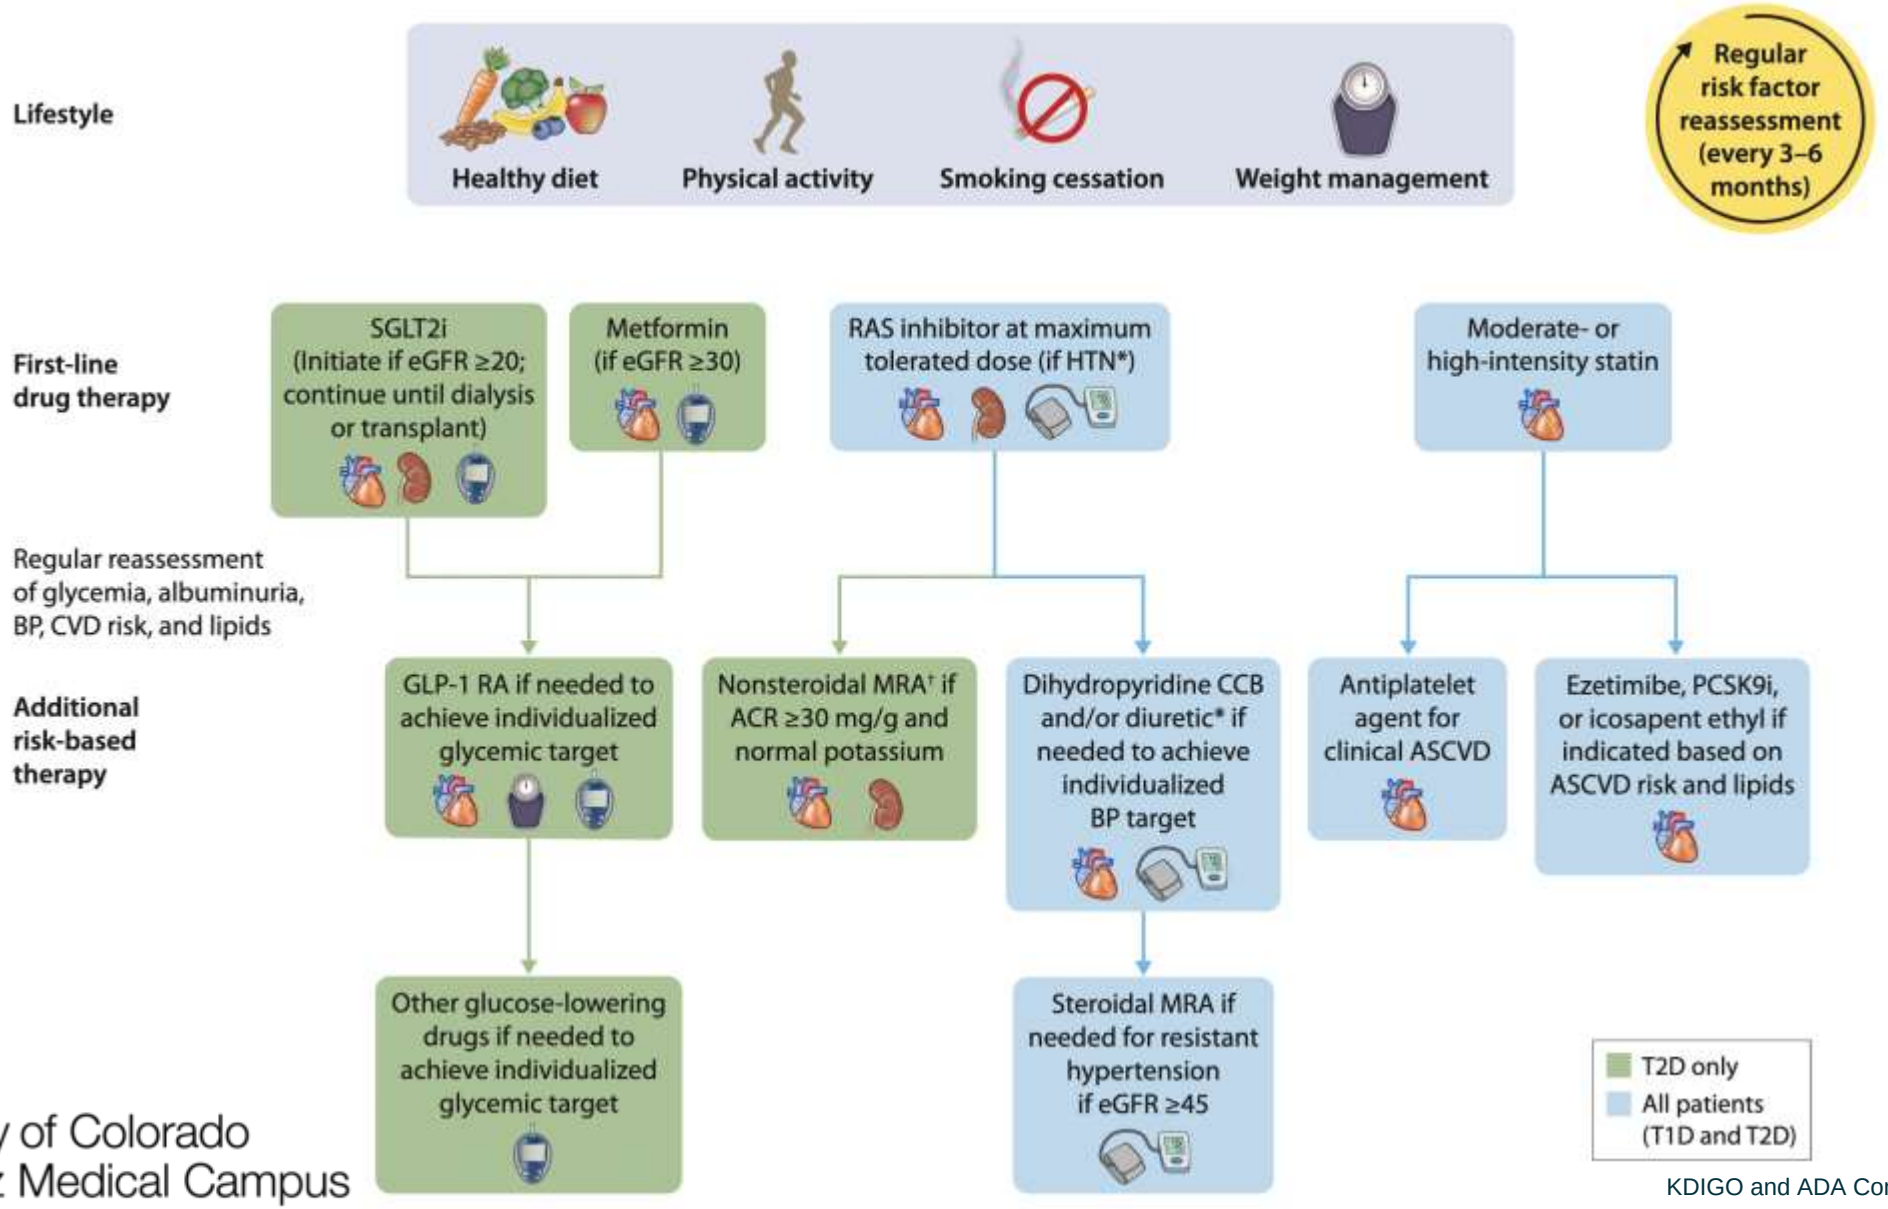
Persistent eGFR <60 mL/min/1.73 m^2

and/or

Other evidence of kidney damage

KDIGO Consensus. Kidney Int. 2022

Management recommendations



University of Colorado Anschutz Medical Campus

KDIGO and ADA Consensus. Diabetes Care 2022

Management recommendations

Table 2—Considerations for selecting glucose-lowering agents in patients with T2D and CKD (2,17)

	Progression of CKD	ASCVD	Heart failure	Glucose-lowering efficacy	Hypoglycemia risk	Weight effects	Cost
Metformin	Neutral	Potential benefit	Potential benefit	High	Low	Neutral	Low
SGLT2 inhibitors	Benefit[a]	Benefit[c]	Benefit	Intermediate	Low	Loss	High
GLP-1 receptor			Potential				
Thiazolidinediones	Neutral	Potential benefit (pioglitazone)	Increased risk	High	Low	Gain	Low
α-Glucosidase inhibitors	Neutral	Neutral	Neutral	Intermediate	Low	Neutral	Low

Missing MRA, ERA, and dual and triple incretin agonists

Neutral

Potential benefit or intermediate glucose-lowering efficacy

Benefit (organ protection, high efficacy, low hypoglycemia risk, weight loss, or low cost)

Potential risk or high cost to patient

Increased risk for adverse effects
